Note: Above 85% rh and 40°C a maximum continuous exposure period of 10 days is warranted. Where such exposure occurs the sensor will recover normal electrolyte volumes when allowed to rest at lower % rh and temperature levels for several days.

At the end of the product's life, do not dispose of any electronic sensor, component or instrument in the domestic waste, but contact the instrument manufacturer, Alphasense or its distributor for disposal instructions.

**NOTE:** all sensors are tested at ambient environmental conditions, with 10 ohm load resistor, unless otherwise stated. As applications of use are outside our control, the information provided is given without legal responsibility. Customers should test under their own conditions, to ensure that the sensors are suitable for their own requirements.

## NO2-B1 Performance Data

Figure 2 Sensitivity Temperature Dependence

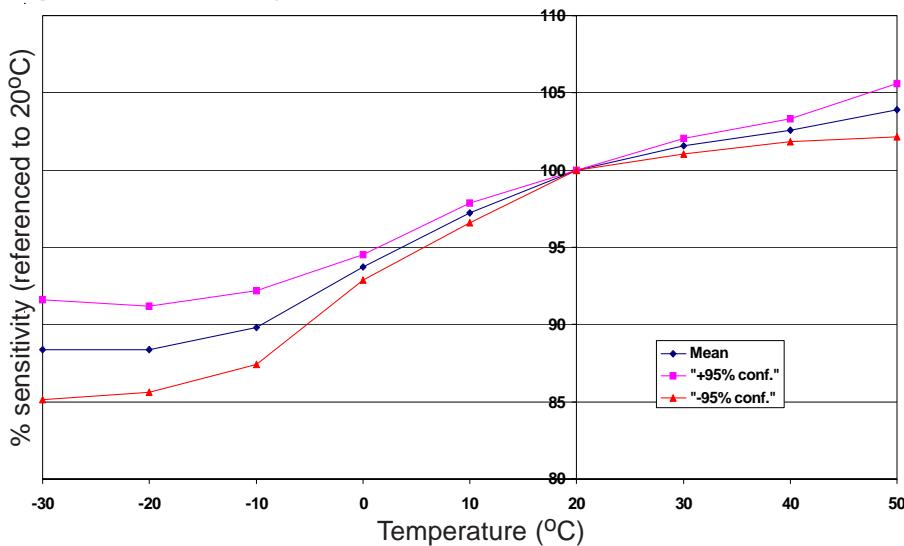

Figure 2 shows the variation in sensitivity caused by changes in temperature.

This data is taken from a typical batch of sensors. The mean and  $\pm 95\%$  confidence intervals are shown.

Figure 3 Effect of Load Resistor Value on Noise

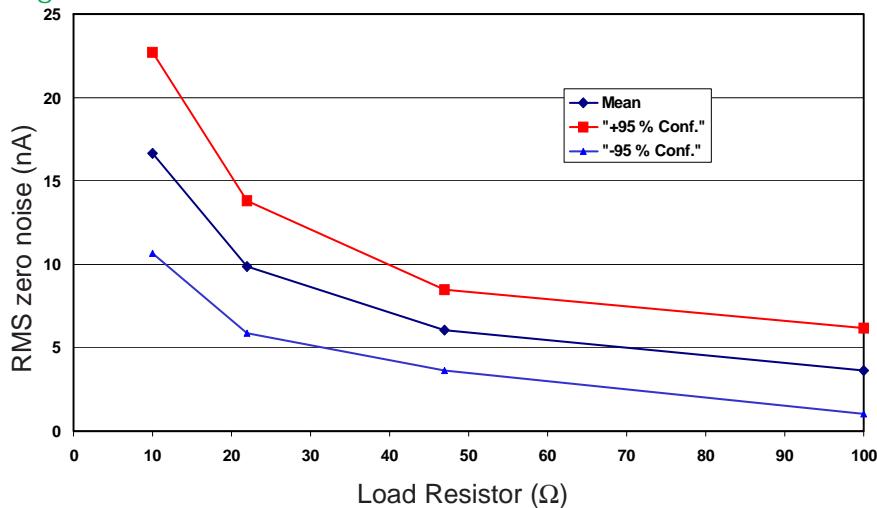

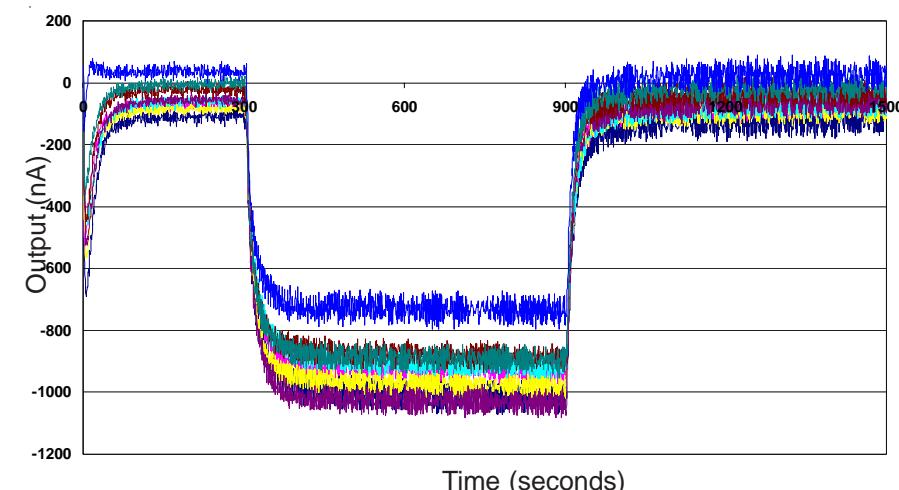

Figure 3 shows the effect of the load resistor on the RMS zero noise for the NO2-B1 sensor. The mean and  $\pm 95\%$  confidence intervals are shown.

The  $t_{90}$  response time increases linearly with increasing load resistor value. If a fast response is required then a  $10\ \Omega$  load resistor should be employed; this will give a fast response.

Figure 4 NO2-B1 Response to 1ppm NO<sub>2</sub>

With a  $33\ \Omega$  load resistor, the NO2-B1 shows excellent resolution, even at the ppb level: ideal for outdoor air environmental testing.
